Education

The Education Program review found the curriculum to be robust with well integrated practice components focusing on the teaching/learning and academic coursework in communication, arts, humanities, social sciences, and mathematics. Students use electronic portfolios to provide evidence of learning. The Program has strong links with community stakeholders including potential employers and clinical placements sites. The Program has sufficient resources to handle current enrollments and well qualified faculty who are active in research and scholarship. Areas in need of attention include increasing the number of underrepresented faculty, staff and students, clarifying assessment criteria and processes, and developing licensure programs in high need areas (e.g., special Education, science and mathematics). Continuation of the program was recommended at all levels of review.
